Microchemical analysis may consequently be defined as the chemical identification of minimal amounts of substance in concentrated solutions. (101) That the crystal form of substance is an extremely important physical property, both as observed on larger and on the minute crystals under the microscope, was strongly brought out in my father s Elements of Physics and Chemistry of 1870 and 1871, as well as in his Analytical Guides, and has always been insisted on in confirming data found in the usual course of qualitative analysis in his laboratory. Visiting chemists have frequently remarked on the great number of microscopes in use in that laboratory. In general practice, however the micro-tests have not yet found their proper place. In special lines, where necessity has forced the analyst to make use of such examinations, he has been richly rewarded. The toxicologist who would to-day rely on color and precipitate examinations only does not exist. The micro-examination of crystallized urinary deposits by the physician has been in practice much longer. These are applications in special fields and not of general practice. But when the mineralogists commenced micro-examinations of single grains of mineral, and applied reagents to produce definite crystallization, a more general microchemical practice took its start, and its importance was impressed on the chemist. Microchemical testing both in the dry way, as blowpipe analysis, and in the...
